This code creates a main window with three labels, three checkbox buttons, and four callback buttons. The first two buttons open separate windows with two images and two labels each. The third button closes the main window, and the exit button closes the entire application.

The application will have a series of questions and images on each window. The user is asked to interact with the program through checkboxes and questions.

The user is also given options like NEXT, BACK, or EXIT within the application for ease of access.

When using the program all three screens will pop up at once. If there is a problem with the buttons simply click to the next screen. At the top in the left hand corner the name of each screen is labeled to help keep track of the order. There is also an exit button and a minimize button in the top right hand corner.

From right to left is the start page, The first window, and the second window.
